                                                                                                                                                                           sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone
                                                                                                                           will be sequenced to completion. In the event that
be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This chimeric repair vector (CRV) SC4 is used in comparative studies on CC the experimental use of a CRV SC1 designed to repair the mutation found CC in Sickle cell disease beta-globin and the beta-globin of a HSC. The CRV CC designed to repair the mutation contains a nucleic acid having at most CC one 3' end and one 5' end comprising a segment of unpaired bases (CC disposed. The unpaired bases separate the nucleic acid into a first CC strand and a second strand, comprising a first region and a second region comprising a first region and a second region comprising a first region and the first region having at least 15 nucleotides. Each nucleotide of the first region comprises at least 8 ribonucleotides which captured to a nucleotide of the second comparate the second region and the first region comprises at least 8 ribonucleotides which captured to 2'-deoxynucleotides, which ribonucleotides captured to at least 15 ribonucleotides captured to a tleast 15 ribonucleotides captured to a tleast 15 ribonucleotides captured to 2 repairing genetic mutations in cells for re-introducing into a patient comparation of a wild-type allele of a human gene. The CRVs can be used for treating diseases. They can be used for treating, sickle cell clience embrycems or hasmoshilia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC This sequence represents a nucleotide analogue of the invention, termed a CC chimeric mutational vector (CMV). This sequence is directed against the CC beta-globin gene. The CMVs (I) are for altering a gene in a CC chimeric cell, and comprise: (a) a first strand (S1) having at least 15 cm cleotides (nt); at least 3 nuclease-resistant ribo-type nt (nt') and at CC least 3 contiguous ribo-type nt, the same as, or additional to, the nt'; CC and (b) a second strand (S2) in which the nt are Watson-Crick (WC) paired to the nt in S1. The contiguous ribo-type nt in S1 are WC-paired to CC to the nt in S1. The contiguous ribo-type nt is other than a CC 2'-0-methyl substituted nt. nt' are 2'-AX-nucleosides; 2'-AX-nucleosides CC -0-methyl substituted nt. nt' are 2'-AX-nucleosides; 2'-AX-nucleosides CC -1-AR-nucleotides; A = oxygen, fluoro, chloro or bromo; when A = 0, CC x = hydrogen or 1-6C alkyl and R = 1-6C alkyl; when A is halo then R and CC x are absent. (I) are used to repair a disease-related mutation in human cells (e.g. those associated with Gaucher's disease, sickle-cell anaemia, the last compared to the cells (e.g. those associated with Gaucher's disease, sickle-cell anaemia,
                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                               thalassemia, familial hypercholesterolaemia, emphysema etc.). The chimeric mutation vectors are also used to inactivate specific genes, i.e. to generate transgenic ('knockout') animals or plants. They are used for biomedical research and for pharmaceutical production. Any eukaryotic gene of known sequence can be altered, by replacement, deletion or addition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide for altering a genomic sequence in eukaryotes - particularly for correcting disease-related mutation(s) and for production of transgenic animals and plants
                                                                                                                                                                                                                                                                                                                                                           Sequence 68

                                                                                                                                                                                                                                                                                                                                                                          The present invention describes double-stranded oligonucleotides (I) containing fragments of wild-type human alleles. (I) are used to repair disease associated mutations in human cells. (I) are preferably used to treat sickle cell aneemia or thalassemia (mutations in the beta-globin gene, including the promoter region), or Gaucher's disease (mutations in the glucocarebrosidase gene), in haematopoietic cells. (I) may also be used to treat familial hypercholesterolaemia (mutations in the lowdensity lipoprotein receptor gene), emphysema (the alpha 1-anti-trypsin gene), haemophilia (the factor VIII gene) or Christmas disease (the factor IX gene), in hepatocytic cells. (I) provides repair of small genetic mutations. The present sequence represents an oligonucleotide
                                      Chimeric oligonucleotide; specific alteration; target sequence; Intramolecular duplex stability; intermolecular duplex stability; intermolecular duplex stability; indicase degradation; chemical stability; bydrolysis resistance; degradation resisitance; A-type helix formation; stable conformation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Double-stranded oligonucleotides with containing a human wild-type allele - useful for repairing mutations in human cells, particularly those causing sickle cell anaemia or thalassemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genome; genetic lesion; haematopoietic stem cell; hepatocyte; RNase; human wild-type allele; mutation; sickle cell anaemia; thalassemia; Gauchar's disease; glucocerebrosidase gene; hypercholesterolaemia; emphysema; haemophilia; Christmas disease; ss.

invention provides chimeric oligonucleotides comprising a stem portion having one or more nucleotides selected from 2'-0-alkyl-ribonucleotides, 2'-allyl-ribonucleotides, 2'-halo-ribonucleotides, 2'-o-methoxyethyl-ribonucleotides, 2'-branching group-ribonucleotides, 2'-o-methoxyethyl-ribonucleotides, 2'-branching group-ribonucleotides, and one or more ribonucleotides or 2'-o-branching group-ribonucleotides, and one or more loop portions. The chimeric oligonucleotides may be used for introduction of specific alterations into target nucleic acid sequences located in living organisms. They have increased intramolecular and intermolecular ouplex stability, increased resistance to nuclease degradation and increased chemical stability, resistance to hydrolysis and degradation, as compared to known chimeric oligonucleotides. They have structures which induce intramolecular and intermolecular Artype helix formation. They have highly stable conformations, as measured by thermal melting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This oligonucleotide is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New chimeric oligo:nucleotide(s) - which are useful for causing specific alterations in target nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CTTCCAACGAGGGATGCTCTACTATTTTTAGTAGAGCATCCCTCGTTGGAAGTGCGCGTT

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                               This chimeric repair vector (CRV) SC3 is used in comparative studies on CC the experimental use of a CRV SC1 designed to repair the mutation found comparison of a MSC. The CRV designed to repair the mutation contains a nucleic acid having at most come 3' end and one 5' end comprising a segment of unpaired bases come 3' end and one 5' end comprising a segment of unpaired bases comed strand, comprising a first region and a second region respectively, each region having at least 15 nucleotides. Each nucleotide of the first region is Watson-Crick paired to a nucleotide Scond cregion and the first region comprises at least 8 ribonucleotides, which are Watson-Crick paired to 2'-deoxynucleotides, which ribonucleotides form at least one ribonucleotide segment of at least 3 ribonucleotides compairing genetic mutations in cells for refintroducing into a patient compairing diseases. They can be used for treating, sickle cell disease, beta-thalassemia, familial hypercholesterolaemia, Gaucher

CC This sequence represents a nucleotide analogue of the invention, termed a chimeric mutational vector (CMV). This sequence is directed against the continuous cell, and comprise: (a) a first strand (S1) having at least 15 cc eukaryotic cell, and comprise: (a) a first strand (S1) having at least 15 cc nucleotides (nt); at least 3 nuclease-resistant ribo-type nt (nt') and at least 3 contiguous ribo-type nt, the same as, or additional to, the nt'; cc and (b) a second strand (S2) in which the nt are Watson-Crick (WC) paired to the nt in S1. The contiguous ribo-type nt in S1 are WC-paired to cc 2'-deoxyribo-type nt, and at least one ribo-type nt is other than a cc 2'-O-methyl substituted nt. nt' are 2'-Ax-nucleosides; 2'-Ax-nucleosides or 2'-AR-nucleotides; A = oxygen, fluoro, chloro or bromo; when A = 0, cc X = hydrogen or 1-6c alkyl and R = 1-6c alkyl; when A is halo then R and cells (e.g. those associated with Gaucher's disease-related mutation in human cells (e.g. those associated with Gaucher's disease, sickle-cell anaemia, thalassemia, familial hypercholesterolaemia, emphysema etc.). The collection mutation vectors are also used to inactivate specific genes, i.e. to generate transgenic ('knockout') animals or plants. They are also used for biomedical research and for pharmaceutical production. Any eukaryotic gene of known sequence can be altered, by replacement,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Genome; genetic lesion; haematopoletic stem cell; hepatocyte; RNase; human wild-type allele; mutation; sickle cell anaemia; thalassemia; Gaucher's disease; glucocerebrosidase gene; hypercholesterolaemia; emphysema; haemophilia; Christmas disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                              containing fragments of wild-type human alleles. (I) are used to repair disease associated mutations in human cells. (I) are preferably used to treat sickle cell anaemia or thalassemia (mutations in the beta-globin gene, including the promoter region), or Gaucher's disease (mutations in the glucocerebrosidase gene), in haematopoietic cells. (I) may also be used to treat familial hypercholesterolæemia (mutations in the low-density lipoprotein receptor gene), emphysema (the alpha 1-anti-trypsin gene), haemophilia (the factor VIII gene) or Christmas disease (the factor IX gene), in hepatocytic cells. (I) provides repair of small genetic mutations. The present sequence represents an oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Double-stranded oligonucleotides with containing a human wild-type allele - useful for repairing mutations in human cells, particularly those causing sickle cell anaemia or thalassemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide SEQ ID NO:95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cole-Strauss AD,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC This invention describes a novel method for determining the degree of CC methylation of a particular cytosine in a motif 5'-cpG-3', present in a CC genomic sample of DNA. The sample is treated chemically to convert CC cytosine (C) but not methylated C, to uracil, then part of the genomic CC The amplicon is hybridised to two classes, each with at least one CC member, of oligonuclectides and/or peptide-nucleic acid (PNA) oligomers CC and the degree of hybridisation to both classes is determined from the Clabel on the amplicon. From the ratio of labels hybridised to the two Cclasses of oligomers, the degree of methylation is calculated. The method CC is used: (i) for diagnosis and/or prognosis of side effects of CC therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders CC of the central nervous, cardiovascular, gastrointestinal and respiratory cystems etc., particularly by detecting mutations or single nucleotide CC polymorphisms (SNP's); and (ii) for differentiation of cell or tissue CC methylation status of many C residues to be determined simultaneously. ABD13410-ABQ54121 represent genomic DNA sequences used to illustrate the CC method for determining the degree of cytosine methylation described in CC the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

This invention describes a novel method for determining the degree of CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a CC genomic sample of DNA. The sample is treated chemically to convert CC genomic sample of DNA. The sample is treated chemically to convert CC DNA that contains the target C is amplified to form a labeled amplicon. CC The amplicon is hybridised to two classes, each with at least one member, of oligonuclectides and/or peptide-nucleic acid (PNA) oligomers CC and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two CC classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders CC therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders CC systems etc., particularly by detecting mutations or single nucleotide CC types and for investigating cell differentiation of cell or tissue CC types and for investigating cell differentiation. The method allows the CC methylation status of many C residues to be determined simultaneously.

CC abglatone of the invention.

CC method for determining the degree of cytosine methylation described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 12; 56pp + Sequence Listing; 56pp; German
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-SEP-2001;
                                         the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             amplicons from chemically treated DNA

                                                                                                                                                                                                                                                            neurological disease; infection; human; secreted protein; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABL36412 to ABL38645 represent human colon tumour antigen cDNA clones (I) which were isolated from human colon tumour and colon metastatic tumour cDNA libraries. (I) have cytostatic activity and can be used in vaccine production. (I) can be used for stimulating and/or expanding T cells specific for a tumour protein on contact with the T cells. They are also useful for inhibiting the development of cancer in a patient. (I) can be mutant species primers for nucleic acid hybridisation, for preparing can be used in the diagnosis of a colon tumour.
                                                                                                                                                                                                                                                                                                                                        Human polynucleotide SEQ ID NO 23.

17-NOV-20
     The invention relates to novel human polynucleotides (AAI99513-AAI99538) and the encoded proteins (AAM99915-AAM99934) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, line, or increasital. (h) immune disorders and addison's disease.
                                                                                                                                Claim 1; SEQ ID NO 23; 465pp + Sequence Listing; English.
                                                                                                                                                                      New nucleic acids and polypeptides, useful for treating, preventing or

 (b) immune disorders e.g. Addison's disease
```

î

The invention comprises the amino acid and coding sequences of six human genset metabolic genes (GMG-7A, GMG-7B, GMG-8, GMG-9, GMG-10 and GMG-11). The GMG DNA and protein sequences of the invention are useful for treating or preventing metabolic-related disorders, such as: obesity;

impaired glucose tolerance; insulin resistance; Syndrome X; Type II diabetes; hyperlipidaemia; atherosclerosis; hypertension; and heart

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and treatment of cancer, leukaemmia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAK52451;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diseases (e.g. cardiac insufficiency, coronary insufficiency or high blood pressure). The GMG DNA and protein sequences of the invention may also be used as insulin sensitisers - for improving insulin sensitivity in persons with non-insulin dependent diabetes mellitus. The present cDNA sequence encodes the human GMG-7A protein.

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity and may be useful in the diagnosis and/or treatment of cancer lankagemia across a subject of the content of cancer lankagemia across a subject of the content of cancer lankagemia across a subject of the content of cancer lankagemia across a subject of the content of cancer lankagemia across a subject of the content of cancer lankagemia across a subject of the content of cancer lankagemia across a cancer lankagemia across a content of cancer lankagemia across a content of cancer lankagemia across a content of cancer lankagemia across a cancer lankagemia across a content of cancer lankagemia across a content of cancer lankagemia across a cancer lankag

treatment of cancer, leukaemia, nervous system disorders, arthritis and

a

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's P1 and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Local Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2 CTTCCAACCTACGTAGCAGAAAGTTTTTACUUUCUGCUACGTAGGUUGGAAGGGCGCGT 60
